

Crop List Template

This google docs tab provides the outline for the **yearly crop list**. This sheet keeps a list of all the vegetables that are being grown that year along with their unit prices, and crop family.

This is the sheet that INITIAL data entry is done on. This data entry will be done by the farm manager and NOT by students. ALL columns require data entry. Each vegetable that will be planted/harvested that year needs to be put in this tab at the beginning of the year!

Each vegetable **requires three pieces of data**: Name, Unit Price, and Family. This list will be imported into BOTH the Seeding + Harvest Record. This creates a congruent list of crops (and their additional identifiers) for data validation across spreadsheets. (TLDR: need this sheet to create drop-down crop selection + autopopulate crop specific data)

Create 3 headings (in this order)

- Vegetable
- Unit Price
- Family

****if order of columns are changed then array formulas on harvest log will need to be updated**

Example: `ARRAYFORMULA(if(len(B2:B),VLOOKUP(B2:B, 'Price Table'!A:D, 3,TRUE), ""))`

Crop List is where initial data entry will reside

- **Vegetable** drop down list is populated by this list thus if NEW vegetable is being harvested it will need to be added to this list before it will be able to be logged from drop down list
- **Unit price** is also pulled from this list...must have unit price value to populate Cost column too
- **Family** is also pulled from this list...must have family attached to veggie to populate which is a necessary value for web app

****NOTE:** If changes need to be made to the crop list, these need to be done in **this** spreadsheet. Changes **cannot** be made in the imported crop lists that reside in each Harvest + Seeding Records.
