

This document tab group provides the outline for the YEARLY Harvest Log. EACH year will have its OWN Harvest Log following the template provided.

The Harvest Log is made up of two sheet tabs: Harvest Record + Price Table.

The document tabs below give the template for both sheet tabs.

Harvest Record Template

This google docs tab provides the outline for the FIRST of two sheets that live in the Harvest Log. This sheet keeps track of what vegetable + how much is harvested on any given day throughout the year.

This is the sheet that students will perform data entry on. The only columns that require data entry are Vegetable (drop down menu) and Quantity. . The “Notes” column is also open for data entry but is not required. **All** other columns will **self populate** and should be protected + colored to indicate the absence of data entry.

When adding a Harvest Log to the Master Harvest Log, the URL for that YEAR’s Harvest Log (i.e. the sheet that the following document outlines) is what should be copied and pasted into the import function on the Master sheet.

Date

- Format
 - Select column → Format → Number → Custom Date and Time → Select '1930-08-05'
- Protect column
 - Select column → Data → Protect Sheets and Ranges (only allow owner ability to edit since date is autopopulated)
- App Script
 - Go to extensions → App Scripts
 - Copy + paste the following

```
function onEdit(e) {  
  
    const sheet = e.range.getSheet();  
    const editedColumn = e.range.getColumn();  
    const editedRow = e.range.getRow();  
  
    // Check if the edit was made in Column B (column 2)  
    if (editedColumn === 2) {  
        const vegetableValue = e.range.getValue();  
        const dateCell = sheet.getRange(editedRow, 1); //  
Column A (1)  
  
        // If a vegetable was selected and date cell is  
blank, fill today's date  
        if (vegetableValue !== "" && dateCell.getValue()  
=== "") {  
            const today = Utilities.formatDate(new Date(),  
Session.getScriptTimeZone(), "MM/dd/yyyy");  
            dateCell.setValue(today);  
        }  
    }  
}
```

}

- Save project to drive using harddrive icon
- Grey out to indicate auto populated

Vegetable

- Format (MUST have \$)
 - Select column → Data → Data Validation → Criteria = Dropdown (from a range)
→ ='Price Table'!\$A\$2:\$A
- Keep uncolored to indicate data entry column

Quantity

- Keep uncolored to indicate data entry column

Notes

- Keep uncolored to indicate data entry column

Unit Price (per pound)

- Select title cell (F1) then copy + paste the following
- ="Unit Price (per Pound)"; ARRAYFORMULA(if(len(B2:B),VLOOKUP(B2:B, 'Price Table'!A:D, 2,TRUE), ""))}

Cost

- Select title cell (G1) then copy + paste the following
- ="Cost"; ARRAYFORMULA(if(len(F2:F), C2:C*F2:F, ""))}
- Grey out to indicate auto populated

Family

- Select title cell (H1) then copy + paste the following
- ="Family"; ARRAYFORMULA(if(len(B2:B),VLOOKUP(B2:B, 'Price Table'!A:D, 3,TRUE), ""))}
- Grey out to indicate auto populated

Total

- Does not matter how it is set up but make it a column instead of row
 - If total is in a row at the bottom, the app will read this as an observation which it is NOT

Price Table Template

This google docs tab provides the outline for the SECOND of two sheets that live in the Harvest Log. This sheet keeps a list of all the vegetables that are being grown that year along with their unit prices, harvest unit, and crop family.

This is the sheet only requires IMPORTRANGE of Crop List Data.

Create a second tab named “Price Table”

In A1 paste the following:

=IMPORTRANGE("GOOGLESHEET LINK","Crop List!A1:C")

****Edits to the crop list cannot be made on this tab and will result in an error**

If edits need to be made, do so in the individual Crop List Spreadsheet**
